

Collaborating for Digital Health and Care in Europe

More value to data: the role of data intermediaries

Health Data Spaces and Ecosystems Workshop

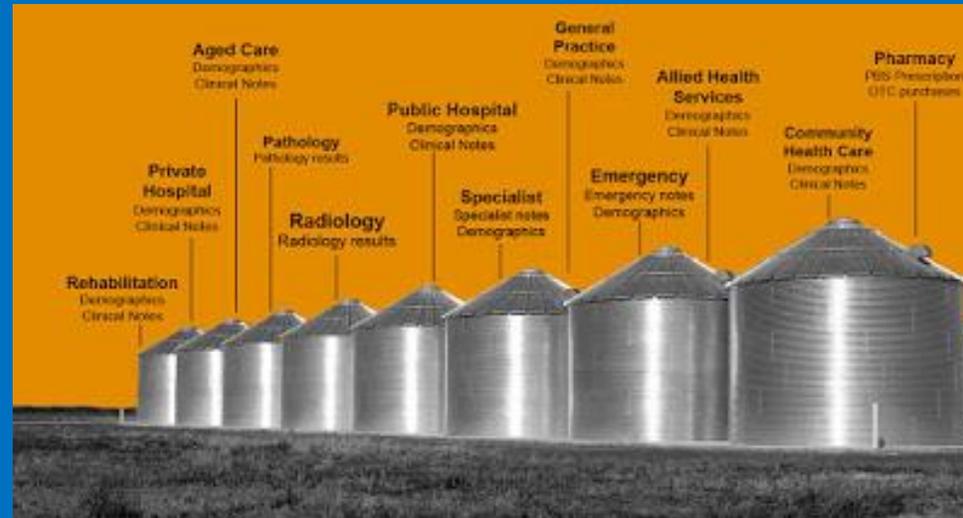

8 November 2021, 15:00 – 16:00 CET

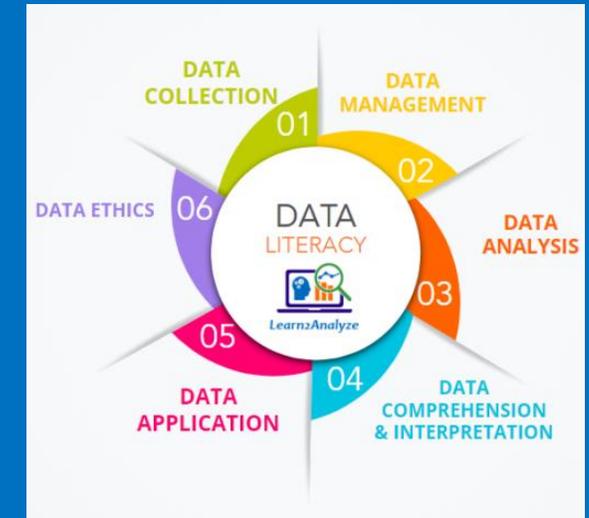

Data on the spotlight

Data-rich

Data silos and interoperability

Citizen-centric data sharing

Trust

8 November 2021

2

Problem statement

“I want to share and contribute but I am concerned about privacy, security, complexity, usability, illegitimate use...”

Data Governance Act proposal - 3 key areas

- (1) access to data held by public sector bodies;
- (2) regulation of data sharing services through **"data intermediaries"**;
- (3) encouraging **"data altruism"**

What are data intermediaries?

Organisations that facilitate greater access to or sharing of data:

- ▶ Cover a range of **different activities and governance models**;
- ▶ Can operate within or across **the public, private, and third sector**;
- ▶ **Enable responsible data access and sharing**, managing and protecting individual rights and privacy;
- ▶ May apply **additional measures to protect** against unethical use of data and ensure it is only used for agreed purposes.

<https://www.gov.uk/government/publications/unlocking-the-value-of-data-exploring-the-role-of-data-intermediaries/unlocking-the-value-of-data-exploring-the-role-of-data-intermediaries>

What are they here for?

- ✓ **Find** personal & non personal data
- ✓ Provide **technical infrastructure** and support to interoperability negotiating sharing arrangements between parties to share, access or pool data.
- ✓ Manage transfers and **usage rights**
- ✓ Ensure data protection acting as **data custodian** allowing remote analysis through privacy-enhancing technologies or providing **independent analytical services** in a siloed environment.
- ✓ Reduce costs and risks associated with **data processing**
- ✓ Assume the **roles and obligations of a data controller and/or processor**

Why would we need intermediaries?

- ▶ Lack of **incentives** to share data > Align incentives to cooperate
- ▶ Lack of **knowledge** > Address knowledge gaps
- ▶ Lack of **standardization** > Enhance quality, interoperability and data portability
- ▶ Commercial, ethical, and reputational **risks** > Limit the purposes for data sharing
- ▶ Legal and regulatory **risks** > Apply privacy-enhancing technologies (PET)
- ▶ **Costs** of data access/sharing > Create trusted research environments (TRE)
- ▶ Missed opportunities to use data in the **public** interest

Categories of data intermediaries

1. Data processors

- Provide data support services to ensure interoperability of data.

2. Data custodians

- **Data exchanges:** Operate as online data platforms where datasets can be advertised and accessed – commercially or on a not-for-profit basis.
- **Data custodians:** Enable privacy-protecting analysis or attribute checks of confidential data, for example, via the application of Privacy-Enhancing Technologies (PETs)
- **Industrial data platforms:** Provide shared infrastructure to facilitate secure data sharing and analysis between companies.
- **Data trusts:** Provide fiduciary data stewardship on behalf of data subjects
- **Trusted third parties:** Provide assurance to those looking to access confidential datasets that the data is fit-for-purpose (e.g. in terms of quality or ethical standards).

3. Personal Information Management System (PIMS)

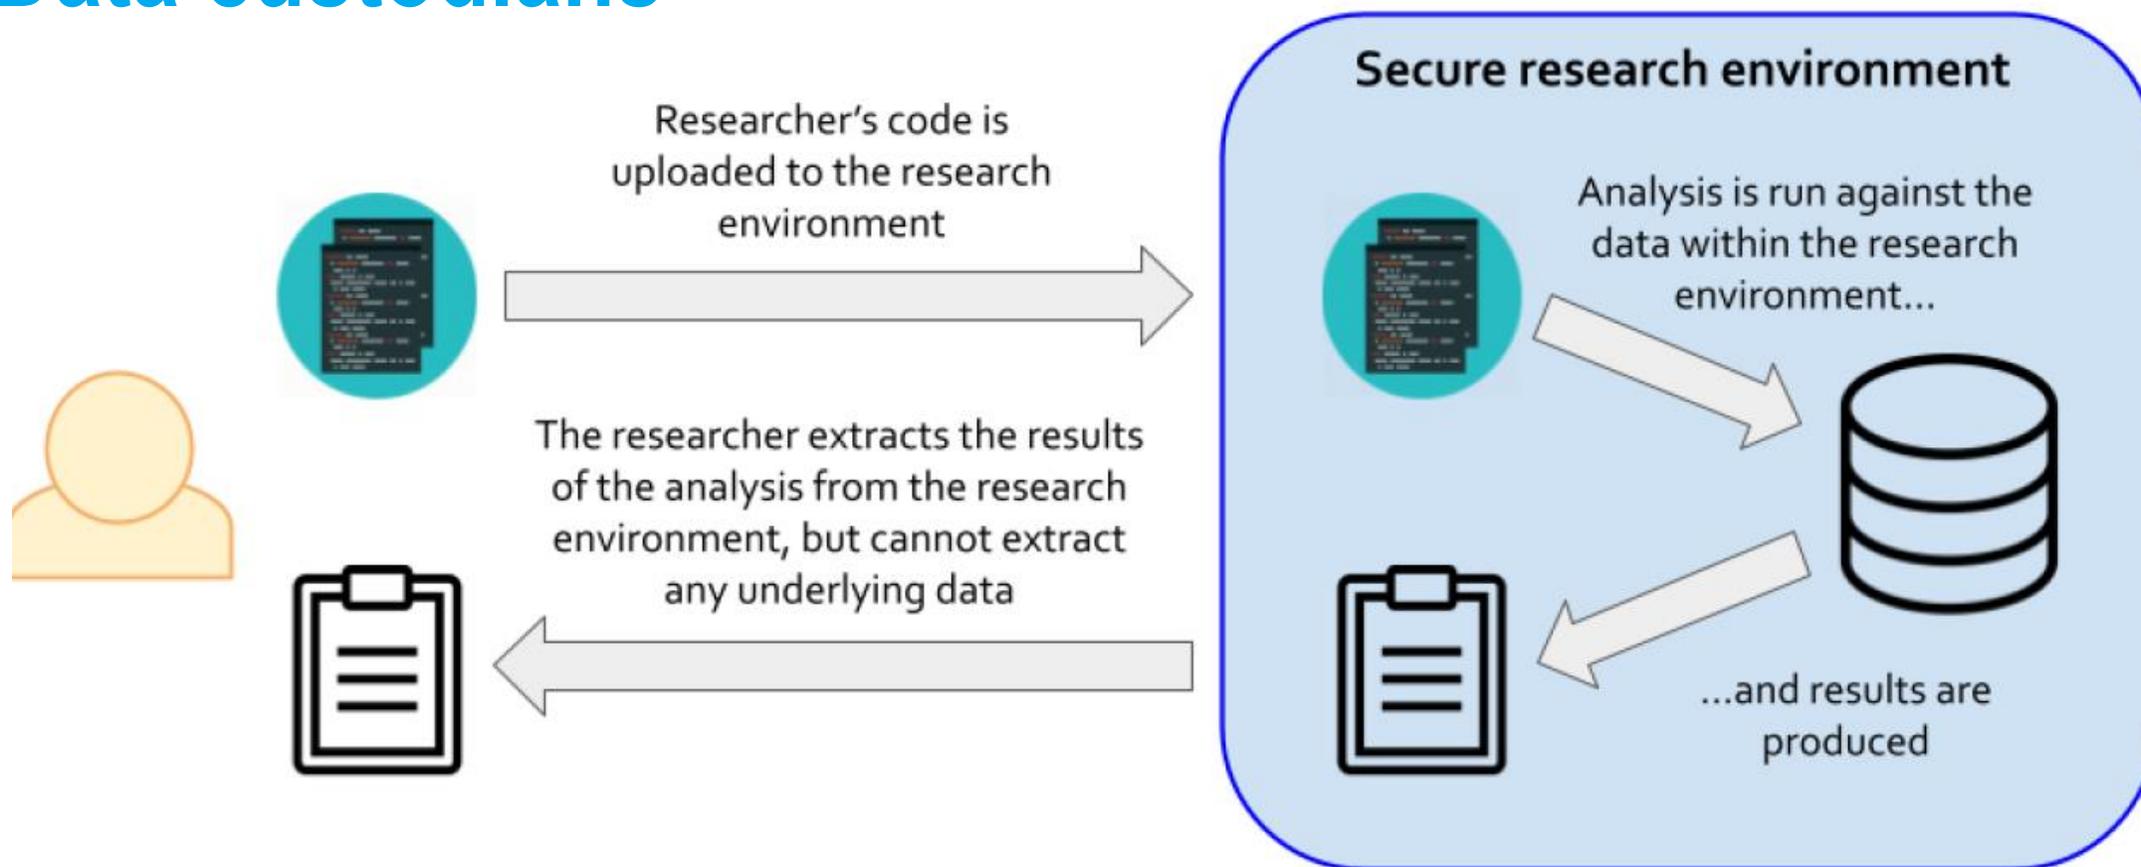

- **PIMS:** Seek to give data subjects more control over their personal data

4. Data collaboratives

- **Data cooperatives:** Enable share data spaces controlled by data subjects

FOCUS

Data custodians

Source: Centre for Data Ethics and Innovation, 2021

Data custodians examples:

secure analytics platform for NHS electronic health records.

connects data providers with data subscribers and offers advanced analytics.

collects sensitive data on the human genome for research purposes

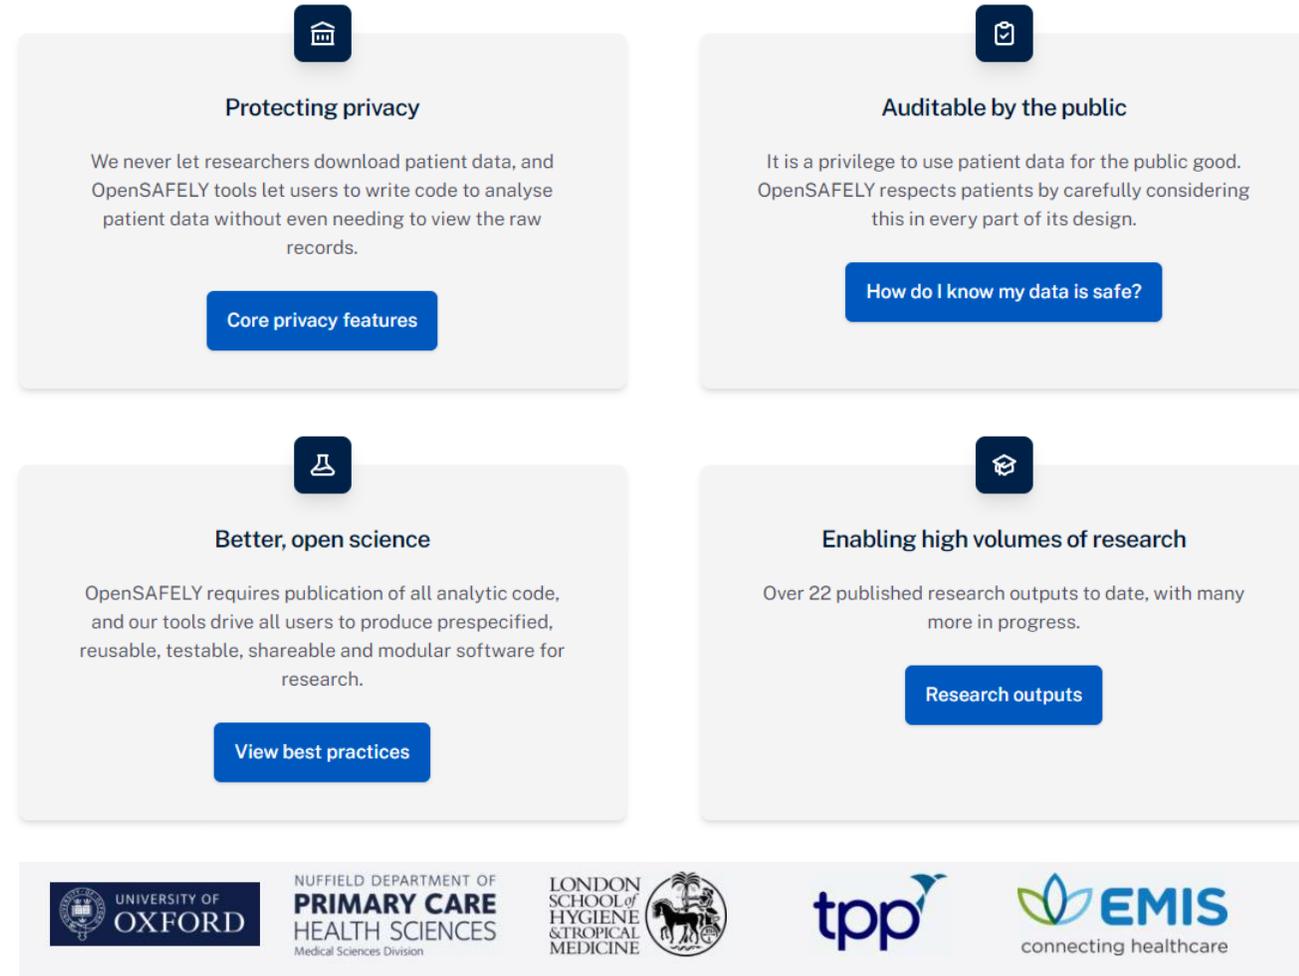

Example 1: OpenSAFELY

Data custodian

Research across over 58 million people's health records

> Identified patients most at risk of dying from COVID

- ▶ Lack of incentives to share data
- ▶ Lack of knowledge
- ▶ Commercial, ethical, and reputational risks
- ▶ Legal and regulatory risks
- ▶ Costs of data access/sharing
- ▶ Missed opportunities to use data in the public interest

The image shows a grid of four benefit cards for OpenSAFELY. Each card has an icon, a title, a short paragraph of text, and a blue button. The cards are: 1. 'Protecting privacy' with a house icon, text 'We never let researchers download patient data, and OpenSAFELY tools let users to write code to analyse patient data without even needing to view the raw records.', and button 'Core privacy features'. 2. 'Auditable by the public' with a document icon, text 'It is a privilege to use patient data for the public good. OpenSAFELY respects patients by carefully considering this in every part of its design.', and button 'How do I know my data is safe?'. 3. 'Better, open science' with a person icon, text 'OpenSAFELY requires publication of all analytic code, and our tools drive all users to produce prespecified, reusable, testable, shareable and modular software for research.', and button 'View best practices'. 4. 'Enabling high volumes of research' with a graduation cap icon, text 'Over 22 published research outputs to date, with many more in progress.', and button 'Research outputs'. At the bottom of the grid are logos for University of Oxford, Nuffield Department of Primary Care Health Sciences, London School of Hygiene & Tropical Medicine, TPP, and EMIS.

Protecting privacy

We never let researchers download patient data, and OpenSAFELY tools let users to write code to analyse patient data without even needing to view the raw records.

Core privacy features

Auditable by the public

It is a privilege to use patient data for the public good. OpenSAFELY respects patients by carefully considering this in every part of its design.

How do I know my data is safe?

Better, open science

OpenSAFELY requires publication of all analytic code, and our tools drive all users to produce prespecified, reusable, testable, shareable and modular software for research.

View best practices

Enabling high volumes of research

Over 22 published research outputs to date, with many more in progress.

Research outputs

UNIVERSITY OF OXFORD | NUFFIELD DEPARTMENT OF PRIMARY CARE HEALTH SCIENCES | LONDON SCHOOL OF HYGIENE & TROPICAL MEDICINE | TPP | EMIS connecting healthcare

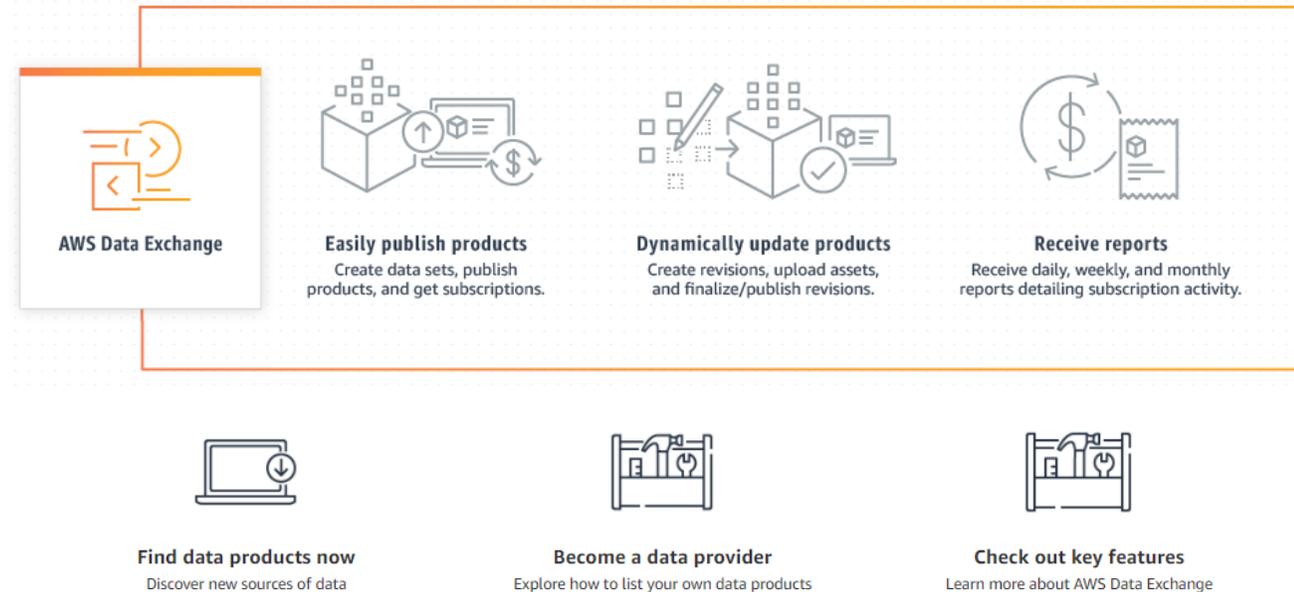

Example 2: AWS DATA EXCHANGE

Data custodian

Aggregates and stores **non-personal data** from public and private organisations.

API integrated into **ConvergeHEALTH** (Deloitte) to find, subscribe and use third-party data and analyze it in the cloud.

- ▶ Lack of incentives to share data
- ▶ Lack of knowledge
- ▶ Commercial, ethical, and reputational risks
- ▶ Legal and regulatory risks
- ▶ Costs of data access/sharing
- ▶ Missed opportunities to use data in the public interest

AWS Data Exchange is unlocking a number of data sources that have traditionally been locked in siloes spanning multiple organizations and **gives healthcare stakeholders a scalable and secure service to create new collaborative business models** to reimagine how they approach research, clinical trials, pharmacovigilance, population health, and reimbursement.

Example 3: Genomics England

Data custodian

Genomics England operates as a trusted research environment (TRE), granting public and private researchers access to its anonymised data for specific research projects.

- ▶ Lack of incentives to share data
- ▶ Lack of knowledge
- ▶ Commercial, ethical, and reputational risks
- ▶ Legal and regulatory risks
- ▶ Costs of data access/sharing
- ▶ Missed opportunities to use data in the public interest

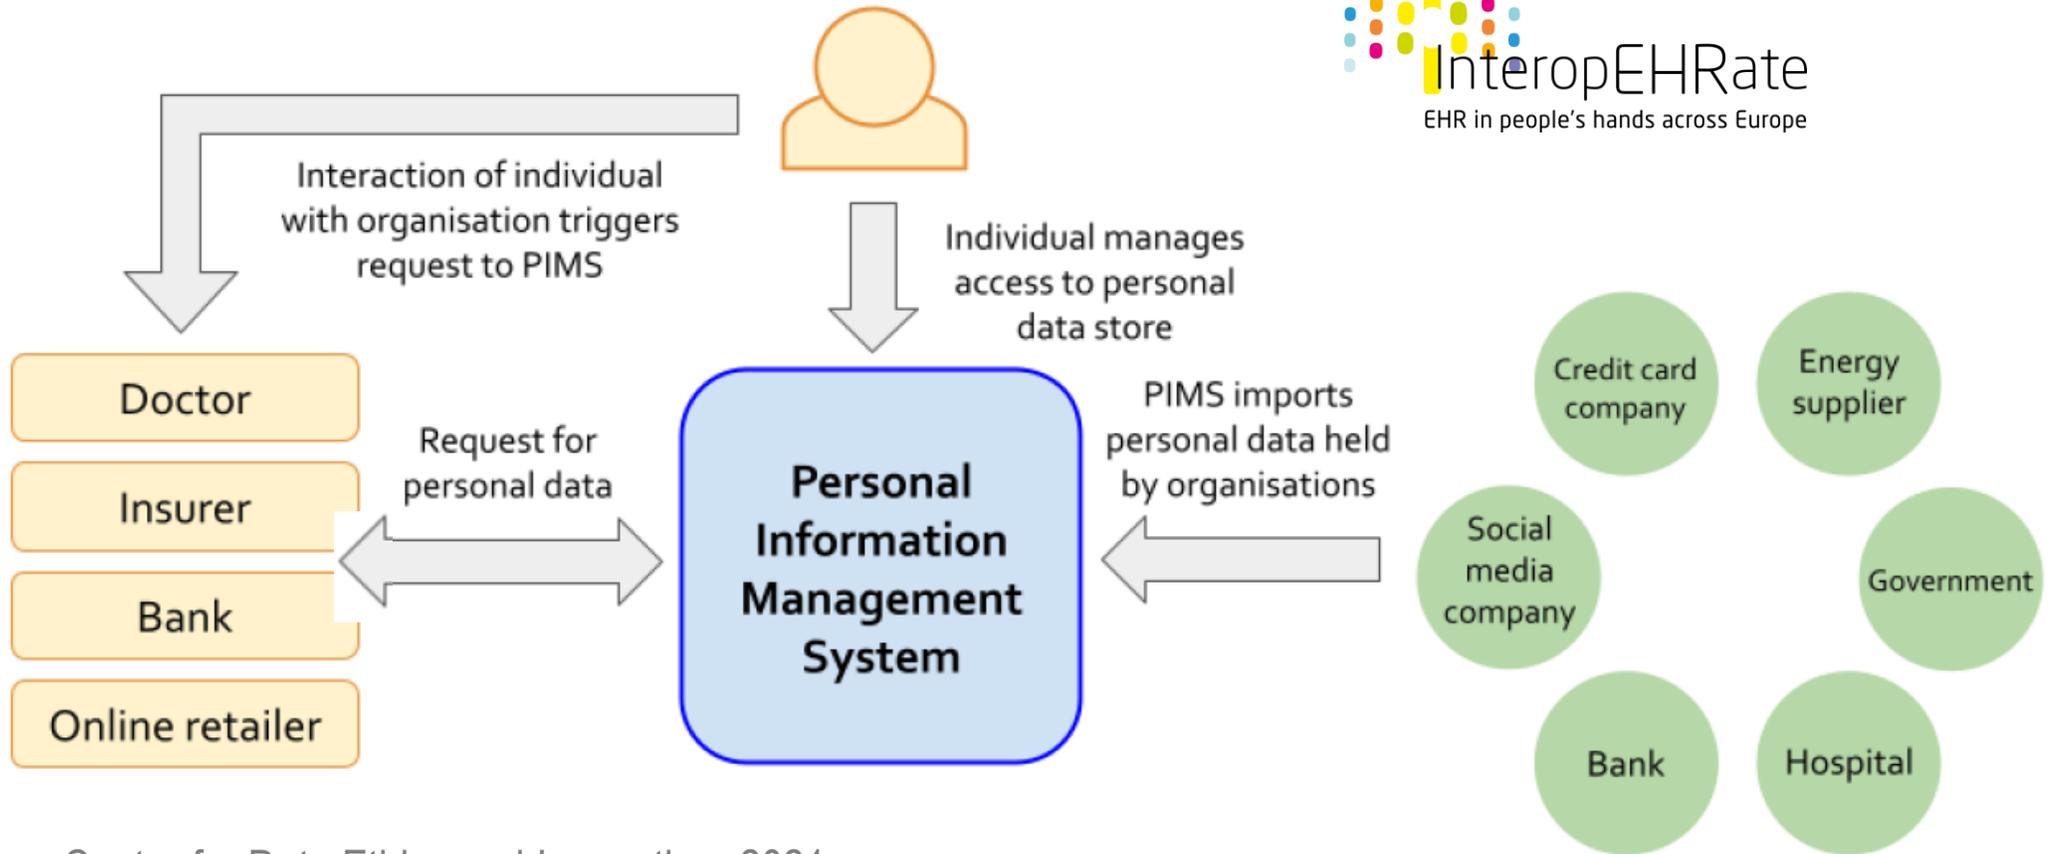

Genomics England never allows the data to be removed from its secure data centre, monitors all activity undertaken by researchers

The PIMS model: focus on citizens and patients

Enabling individuals to control how data about them is used and for what purposes

- ▶ Difficulty to have a full overview of and control over the data they share
- ▶ Demand for mechanisms to “**rebalance the current power imbalance between individuals and corporations**”
- ▶ **Return control to users by enabling all information related to them to be stored in a single location and managed through a single interface**
- ▶ Provide fine-grained control over who has access to data about them, and are empowered to withdraw that access at any time
- ▶ facilitate an individual’s right to erasure under existing data protection legislation by automating the process of requesting data deletion from an organization
- ▶ **Enable** automatic opt-outs on data sharing for uses that may be considered undesirable
- ▶ **Could provide fine grained identity management features**

The PIMS model

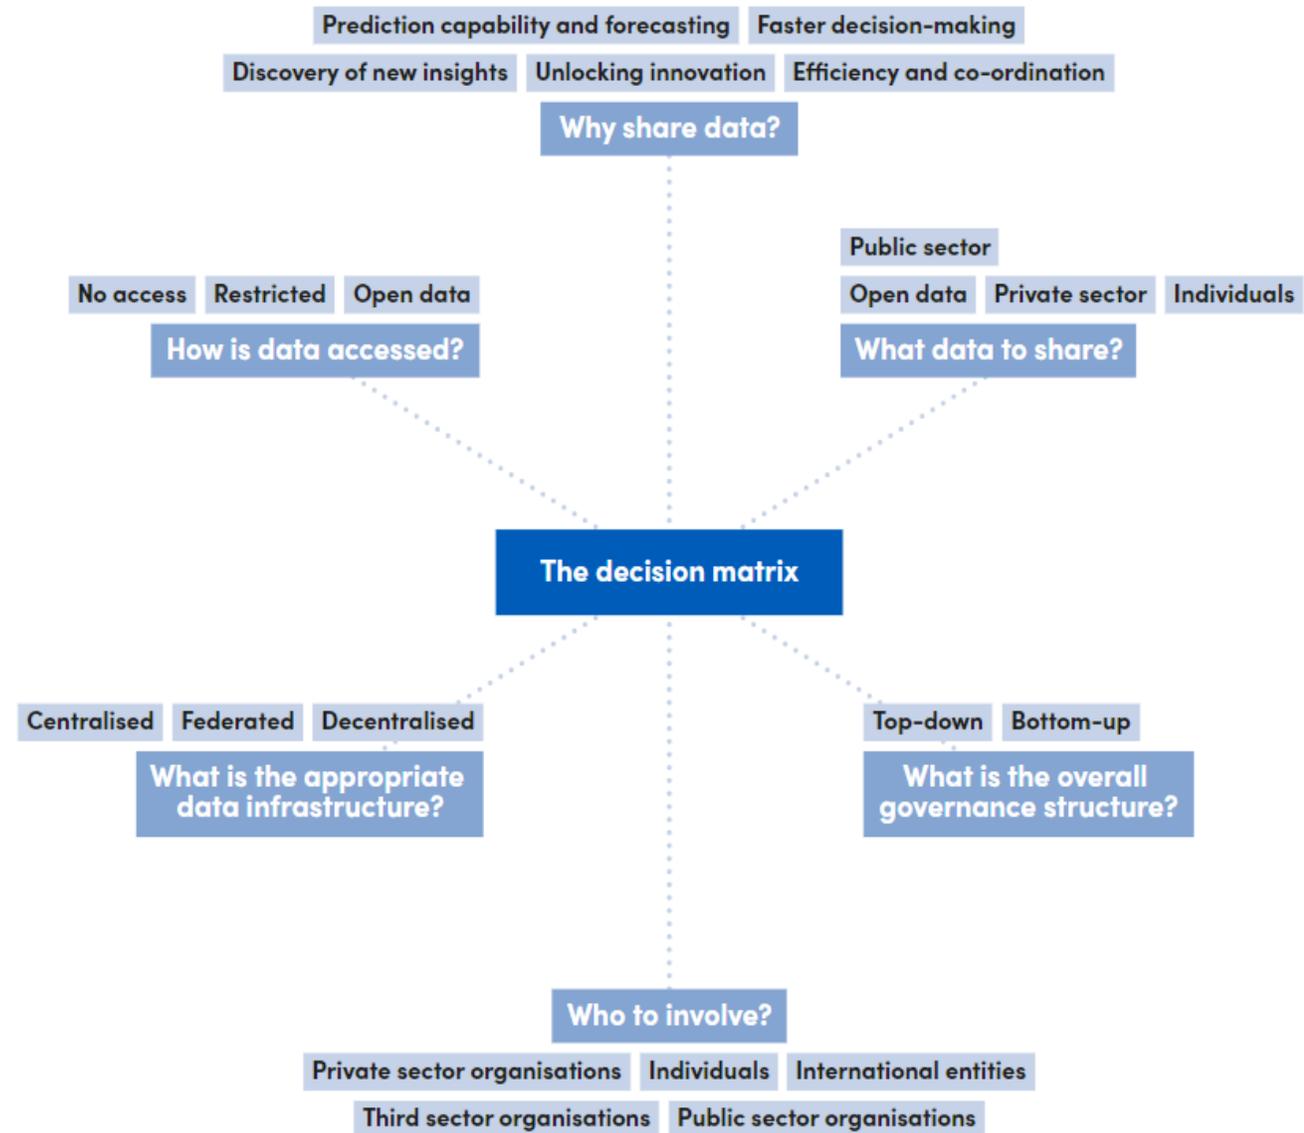

Source: Centre for Data Ethics and Innovation, 2021

Example 4: NESTA DECODE

Not-for-profit PIMS

A toolkit to provide useful **guidance and resources** for private and public organisations to prepare for and design data-sharing initiatives, helping them identify **the right combination of options** for the specific and unique context for the given circumstances.

- ▶ Lack of incentives to share data
- ▶ Lack of knowledge
- ▶ Commercial, ethical, and reputational risks
- ▶ Legal and regulatory risks
- ▶ Costs of data access/sharing
- ▶ Missed opportunities to use data in the public interest

DECODE provides decentralized, privacy-enhancing, rights preserving tools to give back data sovereignty to people and enable citizens' digital right

1 Modular and interoperable.

DECODE tools can be combined and used as part of any platform or app.

2 Free and open source.

All work produced by the project is published as free and open source.

3 Decentralised & blockchain-enabled.

In DECODE operations are processed, validated and updated on the [Sawtooth](#) ledger platform.

4 Privacy enhancing.

Personal data on DECODE is defined in terms of [Attribute-Based Credentials](#) collected and stored in a secure digital wallet.

5 Based on cutting edge research.

Based on the selective disclosure credential scheme [Coconut](#), providing full blockchain integration.

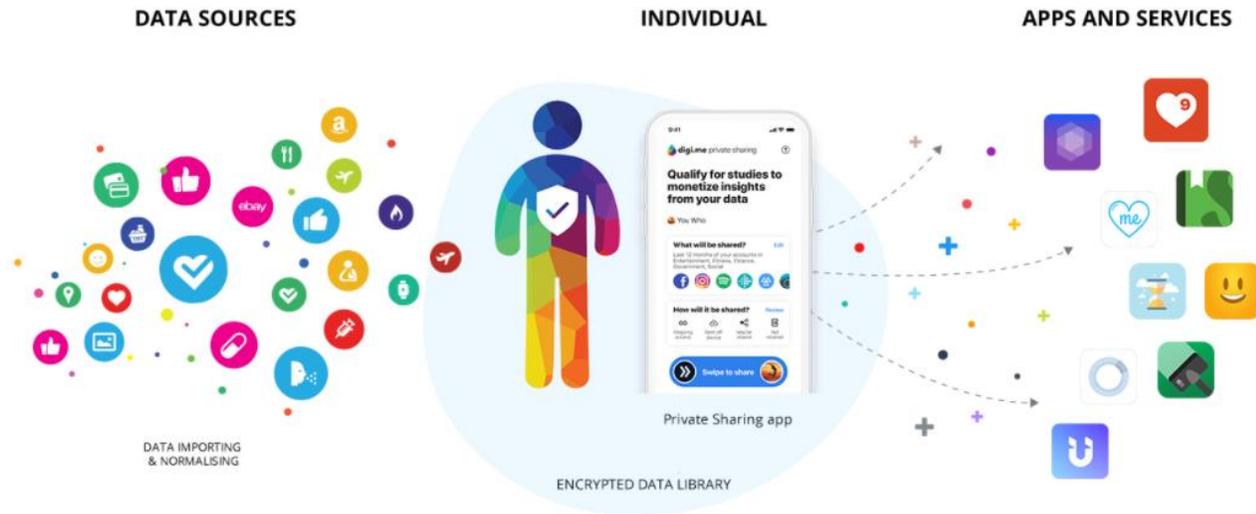

Pilots

- Digital Democracy and Data Commons (DDDC)
- Citizens' IoT Data Governance
- Anonymous Proof of ID
- Ethical Social Network

Example 5: DIGIME

For-profit PIMS

Chosen in ICELAND for PHR storage (and sharing)

England - NHS GPSoC

Status: Reviewed and approved

USA - Epic / Cerner

Status: Reviewed and approved

Netherlands - Medmij

Status: Audited and certified

Iceland

Status: Audited and approved

Connect with your digital life
Health, finance, wearables, social and entertainment
Here's examples of the available data sources.

Health	Finance	Social

Example 6: SOLID Project

PIMS in Pilot

Solid is a [specification](#) that lets people store their data securely in decentralized data stores called **Pods**.

Pods are like secure personal web servers for data. When data is stored in someone's Pod, they control which people and applications can access it.

Piloted in Manchester (UK) and Flanders (Belgium)

Get a Pod

Pods are where you store your data. Any kind of data can be stored in a Solid Pod. Once stored in a Pod, you control who can access your data.

You can get a Pod from a Pod Provider, or you may choose to self-host your Pod.

Key messages

- ▶ Data intermediaries can play a vital role in accelerating data-driven **innovation** and overcoming **standards** adoption bottlenecks.
- ▶ **Transparency** of data intermediaries operations are fundamental to gain **trust** and credibility in data markets.
- ▶ They can become **health data ecosystem** creators or facilitators, enabling a **citizen-centric health data sharing** approach.

What's next?

#EHTEL_Symposium

2021 Thought Leader EHTEL Symposium

Imagining a citizen-centric
health data ecosystem

30 November – 1 December 2021

Free participation

Online

EHTEL

With the support of

SITRA

#Imagining2029

Session 2.

**Enabling citizens to be in better
control of their own health data.**

30 November 14:30

We will learn more about:

- Data cooperatives
- Dynamic consent
